The present invention relates to the isolation of a novel cytokine, zalphall Ligand and the polynucleotide encoding it. The invention algives the sequence for the zalphall receptor and the polynucleotide encoding it. The zalphall Ligand polypeptide stimulates proliferation natural killer (NK) cells or NK cell progenitors, the activation of
                                                                                                                                                                                                             New zalphall ligand polypeptides and polynucleotides, useful for stimulating proliferation, activation, differentiation and/or of inhibition of specialized cell function, or for stimulating

The zalphall Ligand polypeptide is also useful in preparing antibodies that bind to zalphall Ligand epitopes. The zalphall Ligand polynucleotides can be used as probes or primers to clone regions of a zalphall Ligand gene, and in gene therapy. Zalphall Ligand may also be used to identify inhibitors of its activity, to enhance the generation of anti-tumour responses with or without the infusion of donor lymphocytes, and to activate or stimulate the immune system. The present sequence represents human zalphall receptor polypeptide

The invention relates to a novel method for treating or preventing an CC arthritic disorder in a subject. The method involves administering to the Subject an interleukin-21 (II-21)/II-21 receptor (II-21R) antagonist CC optionally in combination with another therapeutic agent, to inhibit or CC treating or preventing cancer or an infectious disorder, in a subject, by CC administering II-21/II-21R agonist, to increase immune cell activity. The CC method of the invention has antirheumatic, antiarthritic, osteopathic, CC immunosuppressive, antidiabetic, neuroprotective, dermatological, CC antilulcer, antiasthmatic, antiallergic, antianaemic, hepatotropic, CC treating or preventing an arthritic disorder such as rheumatoid CC arthritis or ankylosing spondylitis, and also cancer such as solid CC arthritis or ankylosing spondylitis, and also cancer such as solid CC tumour, soft tissue tumour or metastatic lesion, or an infectious CC disorder such a bacterial, viral or parasitic infection in a mammal, CC preferably human. A method of the invention is also is useful for CC increasing the ability of a vaccine composition containing an antigen to increasing the ability of a vaccine composition containing an antigen to CC elicit a protective immune response in a subject against the antigens. Or from cancer or tumour cell antigen, or expressed on the surface of cancer CC cell. An alternative method of the invention is useful for modulating the ccitivity of immune or haematopoietic cells and thus to treat or prevent a ctivity of immune or haematopoietic cells and thus to treat or prevent a chievent of concernatitis, unlergy, asthma, allergic asthma, anaemia, anaemia, CC hepatitis, Graves's disease, graft versus host disease, and scleroderma. The present sequence is used in an exemplification of the invention

The invention relates to polynucleotides and polypeptides of interleukin21 (II-21) antagonists, that bind with specificity and exhibit an EC50
that is not detectable in receptor binding studies. The antagonists of
the invention have mutations in the D helix of the II-21 molecule, and
can be used to inhibit the activity of II-21 with its cognate receptor.
The II-21 antagonists are useful for diagnosing and treating disorders
involving the abstrant expression or activity of the II-21 polypeptide,
such as cancer, inflammatory and autoimmune disorders, including

cancer, intla

New IL-21 polypeptide and encoding polynucleotide, useful for diagnosing and treating disorders with aberrant expression or activity of the IL-21 polypeptide, such as cancer, rheumatoid arthritis, multiple sclerosis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          myasthenia gravis and diabetes. The polypeptides can also be used to prepare antibodies that bind IL-21 epitopes, peptides or polypeptides, and for enhancing in vivo killing of target tissues. The present sequence is human IL-21 receptor (originally designated zalphall receptor)

                                                                                                                                                                                                                                                                                                      The invention describes a fusion polypeptide comprising at least a fragment of a MU-1 polypeptide and a non-MU-1 fusion polypeptide. The polypeptide is useful in regulating haematopoiesis (e.g. in cases of anaemias) and/or immune responses (e.g. immune response to cancer, infections or to a transplanted organ) and in identifying other members of the haematopoietin superfamily, including cytokines and receptore. The polymucleotide may be used to express recombinant protein for analysis, characterisation or therapeutic use; and as markers for tissues or characterisation or therapeutic use; and as markers for be used as mutritional sources or supplements. This is the amino acid sequence of human MU-1 haematopoietin receptor superfamily chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New fusion polypeptide for regulating hematopoiesis and immune recomprises a fragment of a MU-1 polypeptide and a non-MU-1 fusion polypeptide.
                                                                                                                                                                                                                                                                   Sequence 538

                                         The invention relates to a cytokine receptor designated Zalphall and its nucleic acid sequence. Zalphall protein is useful for detecting ligands that stimulate the proliferation and/or development of haematopoietic, lymphoid and myeloid cells in vitro and in vivo. Zalphall DNA is useful in identifying a region of the genome associated with human disease states. Zalphall protein is useful for treating lymphoid, immune, inflammatory, spleenic, blood or bone disorders. The present sequence in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cytokine spleenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   23-SEP-1998;

The polynucleotide is useful for treating anaemia. The invention is useful for producing zalphall polypeptide and producing the invention is useful for producing zalphall polypeptide and producing the invention is alphall polypeptide. The present sequence is human
